NAME	**DONYL CYPRUS R. BASIO**
PROJECT TITLE	**TechNova: An IT Solutions and Compliance Management System**
SUBJECT: CODE: TIME:	IT15/L Integrative Programming and Technologies 8441 10:00 am - 12:00 nn
TOPIC (Type of Business Process)	#26 Compliance Management Systems
Products/Services	Small IT Consulting and Software Services Company
Deployed Link / Website link	http://technovaitsolutions.runasp.net/
Role Based-Access	Super Admin Acct. (if done) Username: superadmin@gmail.com Password: Admin@123 Admin Acct. Username: admin@gmail.com Password: Admin@123 Client Acct. Username: donylcyprus@gmail.com Password: Employee123 (default)
3rd Deliverables-Deployed Transactions (CRUD)	
Log in-Page (Screenshot)	
	This login page is for TechNova IT Solutions and is designed for two user types, Employee and Supplier. Users first select their role, then enter their company email and password to sign in securely. The form also includes a Remember me option to keep users logged in and a Contact Admin link for support if login issues occur. At the bottom, a Need Access section gives guidance to users who do not yet have credentials, making the page both functional and user-friendly.
Log in-Page - Source Code (Screenshot)	Dashboard (Client/End-User) (Screenshot)	 This Employee Dashboard provides a clear compliance overview by showing key metrics such as assigned policies, pending acknowledgments, acknowledged policies, and overall compliance rate. It helps users quickly track their policy status, view recent compliance actions, and confirm completed acknowledgments in one place. The page is designed to support day-to-day monitoring by making policy progress and activity history easy to access and understand.

Dashboard - Source Code **(Client/End-User) (Screenshot)**	Update/Edit Page (Screenshot)	 The Edit Policy function allows administrators to update an existing policy's details, including the policy title, description, category, uploaded file, and status. It is used to keep policy records accurate, current, and aligned with compliance requirements. Through this form, admins can quickly modify policy content and metadata without creating a new policy entry, helping maintain consistent policy management and version control.

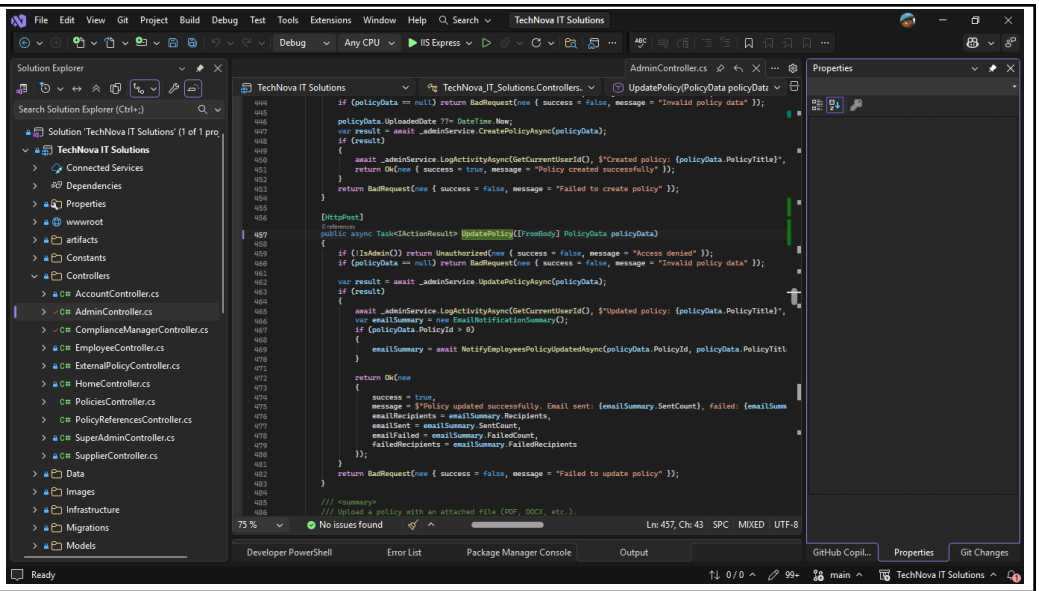
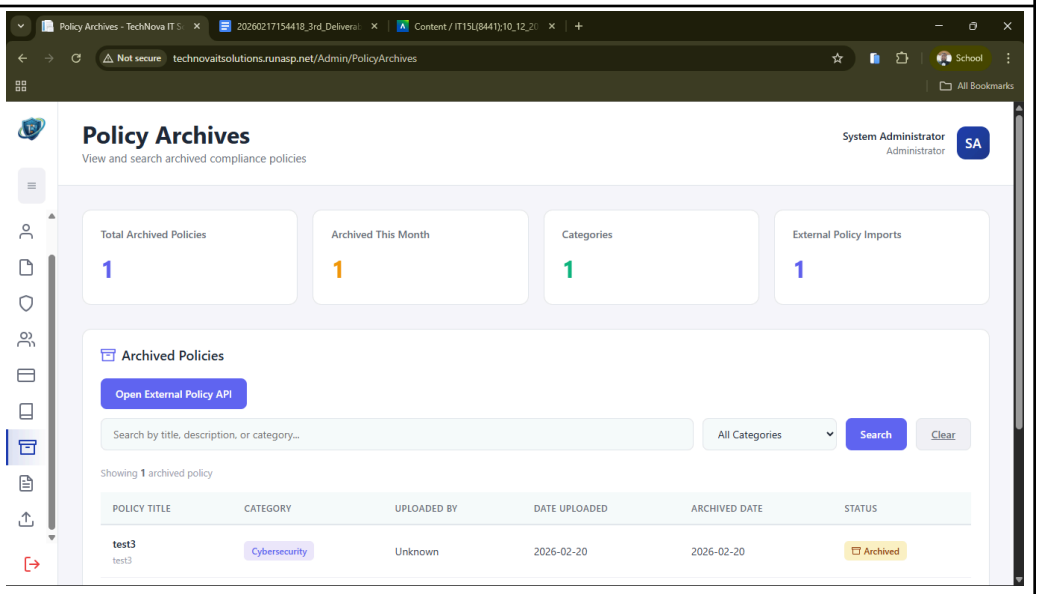
Update/Edit Page - Source Code (Screenshot)



Archive (Screenshot)



The Policy Archives page allows administrators to view, search, and manage archived compliance policies in one centralized location. It provides summary metrics such as total archived policies, monthly archive count, categories, and external policy imports, while also offering filtering and keyword search to quickly find specific records. This function supports compliance tracking and historical reference by preserving archived policies with details like category, uploader, upload date, archive date, and status.

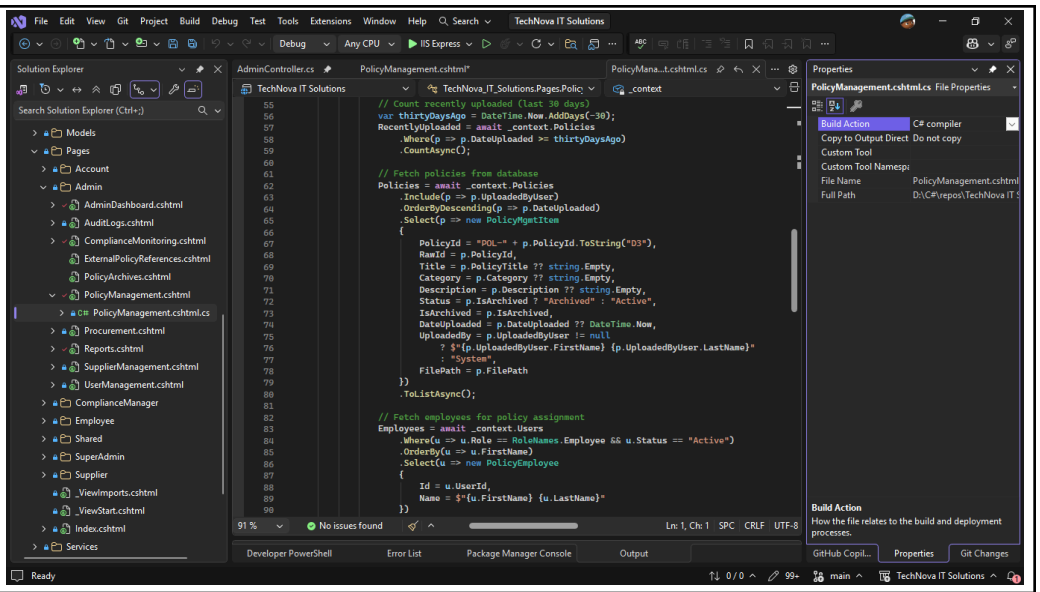
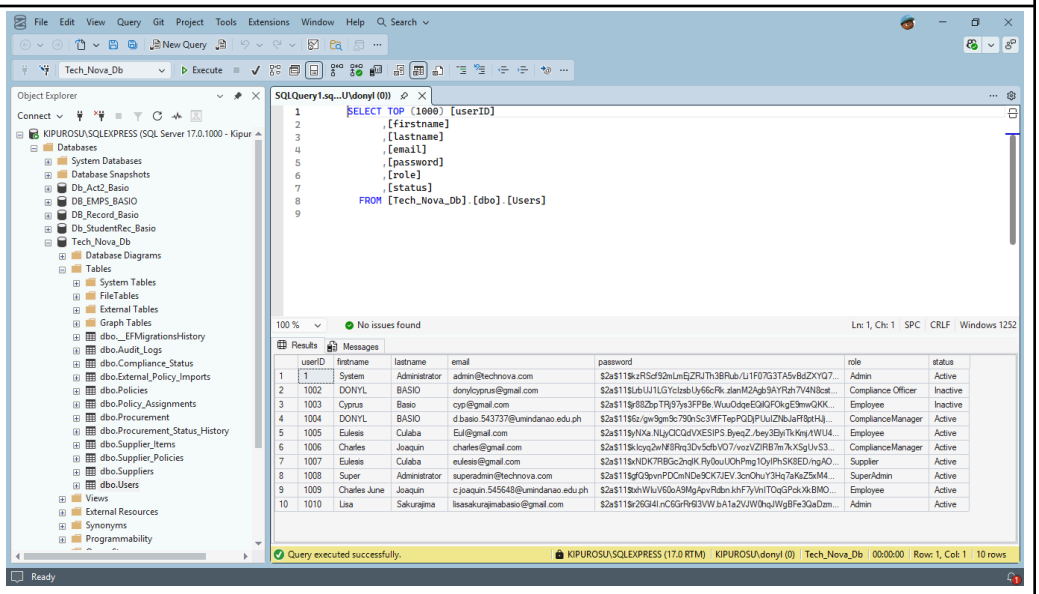
Archive – Source Code (Screenshot)	Display Records (Screenshot)	 The Policy Management page is the administrator's central workspace for maintaining compliance policies and procedures. Its function is to provide a complete view of policy records, including totals and status metrics (active, archived, recently uploaded), while enabling key actions such as searching, filtering by category/status, adding new policies, viewing details, editing, assigning, archiving, and restoring archived items.

Display Records - Source Code (Screenshot)



Database – SQL Server (Local) Screenshot



This screenshot shows SQL Server Management Studio (SSMS) connected to the Tech_Nova_Db database, where a SELECT TOP (1000) query is run on the dbo.Users table to view user records such as userID, name, email, role, and account status. Its function is to let administrators inspect and manage user account data directly from the database for verification, troubleshooting, and maintenance of login and role-based access information.

Database – Deployed/Online **Screenshot**	 This page is the MonsterASP database management overview for your MSSQL instance, where you can monitor database status, plan, quota usage, collation, and compatibility settings, while also accessing connection details needed by your website. Its function is to serve as the main control panel for database administration, including viewing server and login credentials, opening WebMSSQL, running SQL scripts, managing users/tables/backups, and copying the application connection string for your hosted app.
